# BUBIX Middle East: build digital trust, operate lasting services

V3.2 / Middle East business plan - UAE-led development / Build & Operate

AI-generated brand concept / not an actual project photograph.

## MAKE TRUST EASY.

Prioritize national and major industry platforms; validate commercialization through enterprise applications and recurring services. The regional role connects business resources, proposals, contracts, collections and local operations.

The proposed initial capital range is USD 5-10 million. The currency, beneficiary, target year and pre-tax or after-tax basis of the annual profit ambition of 20-30 million remain undefined. Sensitivity analysis therefore tests alternative interpretations.

The six decision materials from v3.1-JD are retained. Supplier economics, local platform operations and equity-related returns are modeled separately, within the existing 27-chapter report structure.

M01 p2 / C01 p3 / C02 p6,9. Public reading edition. Original background materials are not published.

# Role mandate: regional business development and joint operations

Focus on 1-2 countries and connect strategic access, commercial contracts, cash collection and local operations.

| Responsibility | Work package |
| --- | --- |
| Country development | UAE as the primary market; evaluate a reserve country against access, procurement and delivery conditions |
| Two business lines | A: full-stack industrial public blockchain and operations; B: asset digitization / trusted trade platforms and operations |
| Outcome accountability | Record effective contracts, recognized revenue, cash receipts, gross profit and contribution attribution separately |
| Local coordination | Arrange the regional organization, partners, training, on-site presence and headquarters support |

Core responsibilities include executive-level business development, national and enterprise negotiations, collections, local coordination and decision support for headquarters.

Platforms, content and HAA support commercial execution. Actual relationships, working language, project experience and ability to work on site require separate verification.

J01 role and qualification requirements; M01 regional business needs. Plan coverage does not establish verified resources or role eligibility.

# Six decision materials and approval questions

Retain the six-part structure and add joint-operation economics.

| Material | Key output | Decision |
| --- | --- | --- |
| 1 Business objectives | Year-one delivery / acquisition; conditional three-stage path | Whether to initiate and which country to prioritize |
| 2 Annual revenue | Separate supplier and operator revenue schedules | Paying entity and revenue attribution |
| 3 Opportunities and assumptions | Sponsor, authorization, budget, data and willingness to pay | When an opportunity qualifies for forecasting |
| 4 Delivery and cost | Technical scope, engineering effort and local staffing | Delivery ownership and overrun responsibility |
| 5 Cash and stress | Staged funding, payments and stop-investment triggers | How much capital to release and when |
| 6 Target gap | Reverse profit scenarios and a 90-day plan | Add resources, reprice or revise objectives |

H: planning assumptions, not orders, agreed prices, financial forecasts or approved budgets.

# What the evidence establishes

Brand materials describe positioning; financial performance requires contracts, acceptance records and accounting evidence.

| Source | Statements in the material | Evidence boundary |
| --- | --- | --- |
| C01 Overview / 2026.02 | Bridging crypto ecosystems and real economies; 40+ products, 150+ patents | Reported in supplied materials; counts not independently verified |
| C02 DTI / 2026.03 | Build + operate; 140+ patents, 120+ clients, 10+ Fortune Global 500 clients | Reported in supplied materials; patent scope differs from C01 |
| M01 business context | International business and regional development direction | Originals not public; countries, contracts and acceptance status require verification |
| P01 official technology page | Proprietary chain, contracts, privacy, DID, post-quantum research, Agentic AI | Positioning does not establish tested performance or product maturity |
| Historical revenue / approved budget | Primary financial evidence has not been obtained | RMB 96.0865 million is not presented as verified 2023 revenue |

Source categories and public links: files/source-register.json. Background originals are excluded; citation does not mean independent verification is complete.

# Brand mission: bridging crypto ecosystems and real economies

Bridging crypto ecosystems with real economies.

AI-generated brand concept / not an actual project photograph.

## VALUE, IN CLEAR VIEW.

Commercial expression of the mission: enable organizations to verify identities, rights, data and transactions together, and collaborate under explicit rules.

Business value: streamline credential verification, reduce reconciliation, clarify records of asset rights, and constrain and trace AI-agent actions. Any claimed improvement must come from before-and-after pilot measurements.

Proposed campaign statement: VALUE, IN CLEAR VIEW. The two CORE elements express connection, verification and coordinated completion.

National-level describes project scope and the level of cooperation. Claims of state ownership, government guarantees or capability limited to two countries require evidence.

C01 p2-5; P01 official website. Campaign copy is an H proposal, not an adopted corporate slogan.

# Six technologies, four reasons to buy

Group capabilities by business value; website and international materials use slightly different categories.

| Capability group | Business problem | Verifiable delivery |
| --- | --- | --- |
| Proprietary chain + smart contracts | Shared rules and business state across organizations | Node configuration, permission matrix, contract tests and logs |
| DID + privacy computing | Data access and permission to perform business actions | Credential issuance / revocation / verification and access tests |
| Trusted data + Agentic AI | AI uses traceable data and acts within authorization | Data provenance, agent identity, approvals and action audit |
| Security + post-quantum research | Long-term infrastructure migration risk | Supported algorithms and scope, independent testing; distinguish research from production |

P01 https://www.bubi.cn/core-tech ; C01 p4-5. These are proposed acceptance criteria, not claims of completed tests.

# Two business lines: industrial chains and asset / trade applications

Each line has its own buyer, delivery scope and operating responsibility. Infrastructure may be shared; revenue is not counted twice.

| Business line | Buyer and delivery | Revenue and acceptance |
|---|---|---|
| A Industrial public blockchain | Authorized local operator / strategic group; full stack, node governance, tools, interfaces and ecosystem onboarding | Implementation + support + agreed operating services; SOW and operational handover acceptance |
| B Asset digitization / trusted trade | Industry, asset and trade institutions; rights / credential records, cross-organization workflows and reconciliation | Paid solution + implementation / subscription + out-of-plan usage; rights / data workflow and business acceptance |
| RWA + AI value layer | RWA: asset and rights workflows; AI: authorization, data and action traceability | Charge for distinct entitlements; a communication theme alone creates no revenue |

Initial scope centers on software, governance, integration and ongoing operations. Hardware and base-cloud procurement require separate accountable entities, scopes and quotations.

The USD 2.5 million national phase-one implementation assumption covers a defined software work package, not a countrywide infrastructure price. Funding entity and use of the USD 5-10 million capital range remain to be defined.

J01 responsibilities 3-4; C01/C02 products and operating models. Contract rights, licensing, data and support terms depend on the actual project.

# Four separate ledgers: ecosystem scale is not BUBIX revenue

Year-one supplier revenue and local platform revenue may include intercompany transactions.

| Entity / level | Relevant measures | Items to keep separate |
|---|---|---|
| BUBIX supplier | Recognized revenue, costs, collections and receivables | Local customer transaction volume does not automatically belong to the supplier |
| Local operator / JV | Third-party service revenue, operating costs and cash | Purchases from BUBIX are costs / assets, not additional ecosystem revenue |
| Shareholder economics | Agreed dividends / economic rights and invested capital | Equity share multiplied by profit is sensitivity analysis, not distributable cash |
| Network ecosystem | Asset face value, transaction volume, nodes and active clients | Asset value, token price, market capitalization and funding raised are not revenue |

H accounting framework. Consolidation, capitalization, dividends and equity accounting require actual contracts and financial assessment.

# Year-one supplier baseline: USD 3.6375 million from an assumed contract mix

This is the reproducible v3.1-JD supplier scenario, not total Middle East platform revenue.

| Project | Contract value | Year-one recognized revenue |
|---|---|---|
| 2 preliminary solution engagements | 30 | 30 |
| 2 enterprise platforms including support | 170 | 146.25 |
| 1 national phase one including support | 280 | 187.5 |
| Total / USD 10,000 | 480 | 363.75 |

The mix produces assumed cash receipts of USD 4.25 million and regional pre-tax contribution of USD 202,800, before all headquarters overhead, tax and capital costs.

Contract counts, prices, signing months, acceptance and payments are assumptions. Without the national phase-one contract, year-one supplier revenue falls to USD 1.7625 million and contribution becomes negative.

H-SUP. The monthly supplier model and 67 arithmetic checks are supplied separately. Counts, prices and timing are planning assumptions.

# Platform revenue: paying accounts and billable events

Use full-year-equivalent paying volumes rather than multiplying year-end client counts by full-year prices.

| Revenue stream | Y1 assumption | Y2 assumption | Y3 assumption |
|---|---|---|---|
| BaaS / node services | 10 accounts x USD 60k = USD 600k | 30 x USD 80k = USD 2.4m | 48 x USD 100k = USD 4.8m |
| Incremental credential / API usage | 0.5m events x USD 0.20 = USD 100k | 3m x USD 0.20 = USD 600k | 10m x USD 0.20 = USD 2m |
| Application workflows | 8 x USD 50k = USD 400k | 15 x USD 80k = USD 1.2m | 20 x USD 100k = USD 2m |
| AI tenant add-ons | 6 x USD 25k = USD 150k | 15 x USD 40k = USD 600k | 24 x USD 50k = USD 1.2m |
| External platform revenue / USD 10,000 | 125 | 480 | 1000 |

H-OP01. Usage includes only events outside subscription allowances; workflows and AI must not bill twice for the same entitlement. Volumes and pricing are not customer-validated.

# Platform economics: build first, scale only when conditions hold

USD 10,000. Initial technology procurement is fully expensed; this is not an audited profit forecast.

| Item | Y1 | Y2 | Y3 |
|---|---|---|---|
| External service revenue | 125 | 480 | 1000 |
| Variable delivery / channel cost: 45% | 56.25 | 216 | 450 |
| Fixed operating expense | 120 | 200 | 250 |
| Initial technology purchase: fully expensed | 280 | 0 | 0 |
| Planned pre-tax contribution | -331.25 | 64 | 300 |

The initial 280 is the assumed USD 2.8 million purchase of an infrastructure package from BUBIX, recorded as an operator cost. Supplier recognition and payment timing may differ. Do not add this to supplier revenue on the preceding schedule.

Capitalization would require revised amortization, impairment and cash schedules. Capitalization alone does not improve commercial returns.

H-OP02. Excludes tax, financing, out-of-scope changes and additional licensing capital. Y2/Y3 are conditional stages, not promised calendar-year outcomes.

# Cost assumptions and evidence needed to replace them

The 45% rate is a pre-quotation placeholder, not BUBIX historical gross margin.

| Cost | Assumed composition | Replacement evidence |
| --- | --- | --- |
| Variable cost: 45% | Cloud / usage 10% + delivery support 20% + channel / ecosystem 15% | Cloud invoices, timesheets, third-party rates and partner agreements |
| Y1 fixed expense: USD 1.2m | USD 10,000: team 60, partner/legal 20, travel 15, content/events 15, administration 10 | Role quotations, service agreements, employment and office plan |
| Y2 fixed expense: USD 2m | USD 10,000: team 110, partner/legal 25, travel 20, marketing 25, administration 20 | Paying clients, service levels and local organization |
| Y3 fixed expense: USD 2.5m | USD 10,000: team 140, partner/legal 30, travel 25, marketing 30, administration 25 | Actual support workload and renewal quality |
| Technology purchase: USD 2.8m | Phase-one USD 2.5m + annual support USD 300k, fully expensed in this scenario | Detailed SOW, support period and arm-length commercial terms |

H-OP03. Separate fixed team responsibilities from incremental delivery work charged as a revenue percentage to prevent duplicate budgeting.

# Annual profit of 20-30 million: define the measurement basis

Q01: currency, beneficiary, target year and pre-tax or after-tax basis remain undefined.

| Interpretation | Required annual platform revenue / USD million | Assumption |
| --- | --- | --- |
| RMB 20-30m platform profit | 9.52-14.29 | Assumed RMB 7 / USD; 30% pre-tax margin |
| USD 20-30m platform profit | 66.67-100.00 | Same 30% margin |
| RMB ambition attributable to BUBIX; 30% economic share | 31.75-47.62 | Divide target by 30% share, then by 30% margin |
| USD ambition attributable to BUBIX; 30% economic share | 222.22-333.33 | No agreed equity stake or distributable profit is implied |

Q01 / H-REV. RMB 7 / USD is a scenario rate, not a live exchange rate. Net-profit targets require a tax and financing bridge. The 30% margin is assumed.

# The target gap: USD 10 million revenue is not a universal answer

Conditional Y3 pre-tax contribution is USD 3 million; compare it with the profit ambition on a consistent basis.

USD 3 million platform pre-tax contribution equals RMB 21 million at the assumed rate of 7, close only to the lower end of the platform-level RMB pre-tax interpretation.

At an illustrative 30% BUBIX economic share, the corresponding interest is USD 900,000 or RMB 6.3 million. This is neither consolidated revenue nor immediately distributable cash.

If the ambition is USD 20 million annual platform profit, the USD 10 million revenue path is insufficient. Required revenue is at least USD 66.67 million at an assumed 30% margin.

Present year-one delivery milestones alongside mature-platform conditions. Year-one contract scale cannot establish mature-platform profit, and token valuation cannot close the operating gap.

H-REV. Illustrative economic shares do not replace consolidation, equity-method or dividend accounting.

# USD 5-10 million: a candidate capital envelope, not an expense budget

Central illustration: USD 7.5 million. Investor, duration and uses require formal decisions.

| Use of funds | Allocation / USD 10,000 | Release condition |
|---|---|---|
| Phase-one technology procurement | 280 | Agreed SOW, ownership, acceptance and payment structure |
| Year-one fixed operating expense | 120 | Phased hiring and monthly cost review |
| Variable cost and collections working capital | 100 | Triggered by orders / usage / receivable terms; not an extra P&L expense |
| Local integration and scope contingency | 100 | Independent change orders; not treated as already spent |
| Restricted funds / establishment reserve | 50 | Local professional quotations; reapprove funding if insufficient |
| Unallocated liquidity buffer | 100 | Stress analysis and board authorization |
| Total | 750 | Do not add the capital allocation to the profit-and-loss statement |

M01 funding range; H-CAP allocation. Even USD 10m is not a guarantee of licensing-capital adequacy. This schedule is not headquarters approval.

# Release funding through three gates

Submit the USD 5-10 million range for approval only after the investment path is defined.

| Stage | Suggested cumulative ceiling | Acceptance / stop condition |
|---|---|---|
| Days 0-90: resource validation | Budget to be determined; USD 500k is only the earlier model placeholder | Approve the minimum validation work package after confirming access, demand and procurement path |
| Procurement and phase-one delivery | USD 3.5m | Identify buyer / investor, contracts and payments, technical SOW, operator and responsibilities |
| Launch and expansion | USD 7.5m central scenario | Acceptance, paid usage, renewals and unit contribution meet thresholds; monthly approvals |
| Conditions fail | Stop new commitments | No authorization, unfunded budget or sub-threshold usage: reduce scope or pause |

H-CAP. Ceilings are cumulative, not additive. Review prepayments, sunk costs and exit costs contract by contract.

# Cash and stress: cover losses and delays

Simplified operator test: all revenue collected and costs paid within the year; no additional assets.

| Y1 operator stress | Pre-tax contribution / USD 10,000 | Interpretation |
|---|---|---|
| Baseline: 125 revenue, 45% variable cost | -331.25 | 280 technology purchase fully included in cost |
| Revenue / paid volume halves; fixed expense unchanged | -365.625 | Revenue 62.5; variable cost falls proportionally |
| Fixed expense and technology purchase overrun by 20% | -411.25 | Additional cost 80; other assumptions unchanged |
| Only 50% of revenue collected within the year | Net cash outflow 393.75 | Delayed cash does not improve profit; year-end receivables 62.5 |
| Baseline year-end cash if all 750 is available | 418.75 | Simplified cash balance before reserves, restrictions and extra assets |

H-CASH. This is not the peak monthly funding gap. Formal funding needs a rolling 13-week cash schedule; do not automatically add the supplier working-capital assumption of 140 to this envelope.

# Bridge supplier and operator accounts without double counting

The same USD 2.8m purchase is neither additional ecosystem revenue nor freely available cash.

The supplier model assumes a USD 2.8m national phase-one contract, recognizing USD 1.875m in year one by milestone. The operator illustration expenses the entire USD 2.8m as initial construction cost; timing differs.

If the buyer is the local operator, align supplier revenue, operator assets / costs, payments and payables to the same contract. No consolidated statements are invented here.

Clarify whether BUBIX contracts directly for the two enterprise implementations or the JV resells them. Gross or net revenue depends on actual responsibilities; the two models cannot simply be added.

Equity-related sharing is sensitivity analysis only. Service fees, dividends, investment recovery and token rights each require contracts and settlement rules.

H-ENTITY. Finance should prepare a legal-entity chart, related-party transaction register and elimination schedule.

# Opportunity development: establish authority and budget

Strategic access opens conversations; the paying entity and procurement process determine execution.

| Route | Identify first | Evidence to obtain |
| --- | --- | --- |
| Government / authorized operator | Project sponsor, purchasing body, investor and responsible authority | Authorization scope, procurement plan and budget path |
| Major industry / family group | Business unit, asset / data owner and finance lead | Use case, cost baseline and willingness to pay |
| Local integration / advisory partner | Verified track record, delivery capability and customer authorization | Cooperation scope, fees and traceable work products |
| Ecosystem partner | Banks, asset services, identity / data providers | Interfaces, responsibilities, required qualifications and onboarding conditions |

H-GTM. Royal or family access is not government authorization. Compensation must relate to lawful, auditable work, not improper influence on procurement.

# The first 90 days: from verified access to a procurable solution

Verify resources and feasibility before controlled disclosure, proposals and contracting.

| Timing | Priority action | Evidence / deliverable |
| --- | --- | --- |
| D1-15 | Verify primary / reserve-country access and authority; arrange headquarters support | Relationship map, communication records and country-selection rationale |
| D16-30 | Confirm buyers, problems and budget paths for A / B | Two value chains, requirements memo and disclosure scope |
| D31-60 | Define scope, pricing, acceptance, payment and operating cooperation | Proposal, SOW, cooperation terms, delivery and training schedule |
| D61-90 | Advance procurement, contracts and collections; reassess investment and organization | Evidence-backed pipeline, contract / first-payment progress and proceed / reduce-scope decision |
| Ongoing | Weekly pipeline / cash; monthly intelligence, operations and headquarters review | Stage register, 13-week funding plan, risk and decision closure records |

Approve the launch budget from actual staffing, travel, validation and external-service work packages. The prior USD 500k is not a direct recommendation for the 90-day budget.

J01 responsibilities 1-7; M01 development needs. Milestones are plans, not evidence of existing authorization, budgets or orders.

# HAA: business confirmation, AI assistance and expert review

Operating workflow: business confirmation, AI-assisted preparation, expert review and commercial follow-through.

| Step | Method | Check |
| --- | --- | --- |
| Business confirmation | Regional lead confirms buyer problem, access and disclosure authority | A contact list is not proof of deal-making capability |
| AI assistance | Research public policy, organize authorized materials, prepare scenarios and proposals | Source every factual claim; no sensitive data to unauthorized third parties |
| Expert review | Product / commercial teams verify facts, prices and terms and support discussions | Buyer confirms problem, scope and next step |
| Feedback | Record meeting outcomes in the assumption and opportunity registers | Trace source date, accountable role and reason for change |

HAA is a sales operating workflow; Agentic AI is a product capability awaiting validation. Neither establishes paid demand or revenue for the other.

M01 p2; H workflow proposal. AI output does not replace buyer budgets, legal assessment or technical acceptance.

# Communication: turn RWA + AI attention into paid use cases

Every value claim should trace to rights, data and actual use.

AI-generated brand concept / not an actual project photograph.

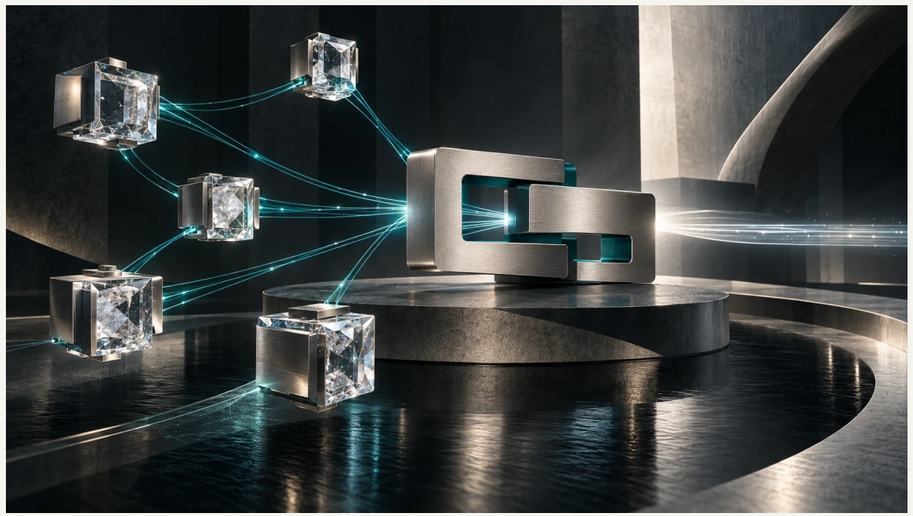

## THE TRUST CORRIDOR.

| Content product | Suggested channel | Conversion action |
|---|---|---|
| 90-second value story | LinkedIn, targeted email, closed-door meetings | Book business discovery; no token-price return promise |
| 5-minute verifiable demonstration | Customer meetings, partner channels, technical communities | Pilot scope and acceptance agreement |
| Use-case evidence card | LinkedIn / X and industry-media interviews | Review sources and pilot method |
| Joint-operation case | Authorized customer / partner content | Invite procurement, technology and finance to assess together |
| Celebrity and major exposure | Not essential entry-stage spending | Assess after paid local cases; exposure does not replace authority or procurement |

H-MKT. Channels are test proposals, not confirmed media or celebrity partnerships. Year-one content / event cost of USD 150k is already in fixed expense.

# Extend CORE: turn technical structure into brand language

Two elements connect organizations; the open window makes value visible; interlocking expresses rules taking effect.

AI-generated brand concept / not an actual project photograph.

## ONE SYSTEM. MANY PROOFS.

Maintain a mature fintech character: graphite, mineral teal and silver. Use one- or two-color flat marks for identity; reserve metallic 3D for campaign visuals and spatial applications.

Strategic imagery emphasizes build, operate and value. Procurement materials emphasize scope, acceptance and accountability; technical materials emphasize structure and test evidence.

Distinguish three evidence states: statements in materials, customer-validated results and planning assumptions. Never invent efficiency percentages for unmeasured capabilities.

Apply the VI manual and production specifications. RWA / AI scenes extend the information hierarchy; untested capabilities must not carry verified-status graphics.

H-VI. The existing VI package remains separate. v3.2 updates the business and content plan; new production assets require design and acceptance.

# Correct potentially misleading narratives before publication

Keep ambition alongside evidence to preserve institutional credibility.

| Risky statement | Public-facing direction | Verification needed |
| --- | --- | --- |
| A token is like company equity | Explain specific rights, responsibilities, use and risks | A marketing analogy does not establish legal rights; assess each category and jurisdiction |
| Only China and the US can deliver sovereign chains | Describe proprietary technology and cross-border infrastructure experience as material statements | Exclusive / unique claims require procurement records and independent evidence |
| Cross-country deployment and commercial results | Distinguish deployment, launch, payment, acceptance and ongoing operations per project | Deployment is not profitability; countries, contracts and acceptance remain to be verified |
| 150+ versus 140+ patents | Do not present one reconciled, verified total yet | Reconcile granted / pending, group / entity, effective date and geography |

C01/C02/M01. P03 VARA guidance supports classification by token features and rights; it does not cover every UAE jurisdiction or establish project licensing.

# Three-stage progression: from projects to a sustainable platform

Y2/Y3 are operating stages; timing moves if demand or licensing conditions are unmet.

| Stage | Required conditions | If conditions fail |
|---|---|---|
| Build and validate | Authorized operator, billable products, initial paying clients and acceptance | Reduce scope and conserve cash; do not imply countrywide coverage |
| Platform growth | Actual renewals, net new clients, reconcilable billable events and positive unit contribution | Fix pricing and delivery cost before hiring further |
| Mature operations | Achieve Y3 assumptions including 48 full-year-equivalent BaaS clients and 10m incremental events | Recalculate if volumes miss; token valuation cannot fill the profit gap |
| Additional investment | Clear accounting, cash recovery path, governance and exit terms | Board reapproval of the investment amount |

H-ROAD. Year-end accounts may exceed full-year-equivalent accounts; mixing them inflates annual revenue.

# External scale reference: possibility is not an order

Zetrix AI illustrates mature-platform scale, but is not equivalent to BUBIX.

Zetrix AI Berhad Annual Report 2025, Note 31, reports blockchain- and AI-related service revenue of RM 643.542 million in 2025 and RM 362.778 million in 2024.

This is a mixed service category within a listed group, not BUBIX revenue, a single-country project or profit. Do not directly apply that scale as a target for a new Middle East operation.

Appropriate use: show how build + operate can produce a different revenue structure from one-off software projects. BUBIX economics still depend on customer contracts, actual usage and attribution.

Without verified historical financials, justify targets using scope, work packages, customer volumes and funding constraints rather than unverified 2023 figures.

P02 https://www.insage.com.my/interactiveAR/ZETRIX/interactiveAR2025/262/ ; printed p261, Note 31. This is a cited reference, not an updated financial comparison.

# Proposed decisions: staged validation and conditional approval

Complete the six decision materials; replace assumptions with formal terms as evidence develops.

Confirm primary / reserve-country selection, regional responsibilities and headquarters support. Review the 90-day budget against actual work packages; USD 500k remains only the earlier placeholder.

Define the funding entity, scope and period for USD 5-10 million. Decide on later releases after contracts and responsibility boundaries are clear.

Confirm currency, pre-tax / after-tax basis, platform / BUBIX beneficiary and target year for the 20-30 million ambition before selecting a reverse-profit scenario.

The report system includes 27 chapters, a website, operating model, source register and arithmetic checks. Material statements and planning assumptions are registered separately.

Public edition / English translation 2026.10.28. Verifiable means reproducible calculations and traceable sources; it does not mean buyer intent or commercial results are validated.
